This version of AutoCAD supports horizontal and vertical drafting and is available in two price tiers: Standard Edition: \$929.00 Professional Edition: \$2,049.00 Standard Edition users can create a drawing set with up to 20 drawings per workbook and 1 MB of drawing storage space. AutoCAD's standard edition supports common DWG file formats (.DWG,.DWF, and.DGN), which can be saved in editable, password-protected draw-only files and printed out, and includes standard features that are typically included in desktop CAD programs. AutoCAD Professional includes all of AutoCAD's Standard Edition features, plus 1 GB of drawing storage, and the ability to save editable, password-protected DWG files.

AutoCAD 2020 Standard Edition is the only version of AutoCAD that supports the Industry Foundation Classes (IFC) standard file format for 3D CAD. AutoCAD 2020 Professional Edition can read IFC files, with the ability to generate files for other CAD applications. All AutoCAD versions can generate interactive presentation (IP) files. The United States is in the midst of a fundamental transformation in its health care system as it moves from a system dominated by physicians making decisions for patients to a system where the patient is an active participant. This transformation occurs in the context of a country whose citizens increasingly express a preference for a person-centered approach to health care. This article examines the effects of this transformation by assessing parents' experience of the roles they play as both decision-makers and decision-acceptors. The study is based on interviews with 599 parents of children with chronic health conditions. The authors conclude that empowering parents to make decisions and express their own needs is a critical part of this transformation. The semiconductor integrated circuit (IC) industry has experienced rapid growth. Technological advances in IC materials and design have produced generations of ICs where each generation has smaller and more complex circuits than the previous generation. However, these advances have increased the complexity of processing and manufacturing ICs and, for these advances to be realized, similar developments in IC processing and manufacturing are needed. In the course of IC evolution, functional density (i.e., the number of interconnected devices per chip area) has generally increased while geometry size (i.e., the smallest component (or line) that can be created using a fabrication process) has decreased. This scaling down process generally provides benefits by increasing production efficiency and lowering associated costs. Such scaling down has also increased the complexity of processing and manufacturing ICs. For example, as semiconductor devices, such as a metal-oxide-semiconductor field-effect transistor (MOSFET), are scaled down through various technology nodes, strained source/drain features (e.g., stressor regions) have been implemented to enhance carrier mobility and improve device performance. Although existing strained source/drain
