SynGUI

SYN, or "synchronize", is a protocol used on the Internet to inform a host that another host (called the "client") is requesting access to its services. When such a request is sent, the target machine will compare the IP address of the sender of the message to the list of known hosts and, if there is a match, will reply back with a SYN packet in order to inform the sender that it is listening to the requested service. In other words, SYN is a request to open a TCP connection between two hosts. A SYN flood attack is a massive and automated attack that sends thousands or even millions of SYN requests to a targeted server, thus preventing it from processing legitimate requests. Denial of service (DoS) refers to a technique where a machine hosts (itself) sends a lot of requests to another host, causing it to crash. This can be used by attackers to distract legitimate users from accessing the real service. SYN flood attacks are attacks that use the SYN flood method to overwhelm the servers of a network. To make a system more stable and more resilient to SYN flooding, SYN count limit can be implemented on the LAN to limit the number of SYN packets that can be sent per time interval. SYN flood attacks are an example of a DoS attack, as the attacker is attempting to force a resource into an overload condition. SynGUI is a desktop applet written in Java. It provides a user-friendly interface for a server administrator. It allows you to perform stress tests by sending a huge number of SYN packets to the targeted server. KEYMACRO is a serial-to-USB dongle that simplifies access to the Window's Keyboard from a non-Windows system. The KEYMACRO can act as a virtual serial port and a virtual keyboard. The virtual keyboard is not strictly limited to what a standard keyboard would allow, and can be programmed to accept special functions as well as special characters. KEYMACRO allows the administrator to secure the keyboard of a Windows system, and remove the need to physically access the keyboard in order to change the password, thereby eliminating any risk of a disgruntled user. KEYMACRO's features include:

- Mouse/Keyboard - KeyMACRO can act as a virtual serial port and virtual keyboard. When connected to a computer running Windows, KEYMACRO will be seen as a serial port that accepts data in "keyboard scan code" format. The virtual keyboard can be programmed to accept special functions and special characters, as well as provide special key shortcuts.
- EZ Mode (KeyMACRO-EZ) - Program the keyboard to accept special characters, functions, and/or key shortcuts with a standard keyboard-layout program such as KeyMACRO-EZ. The "EZ Mode" is useful for a user who wants to program a keyboard using a keyboard-layout program.
- USB-Keyboard - When connected to a USB port, the USB "Keyboard" function can be programmed to accept special characters and/or special functions from a USB-Keyboard.
- Logitech (PS/2) - When the USB-Keyboard is connected to a USB port, the USB-Keyboard function accepts all functions as well as the special characters as a standard keyboard connected via a PS/2 port.
- Auto-detection of a keyboard's type - The device will automatically detect the type of keyboard connected.
- Disconnect detection - If the device is disconnected, it will automatically disconnect from the host computer.
- Com port - If the virtual keyboard is connected to a COM port, it will be connected as a virtual COM port and it will accept all data in serial-port format, such as: ATZ, D0, D1, D2, D3, D4, D5, D6, D7, etc...
- Keyboard Scan Codes - The virtual keyboard is connected to a PC running Windows, and it will allow the programmer to send all scan codes in a format very similar to the standard keyboard data.
