(Representational Image) Global carbon emissions are down. (Representational Image) A week before the British Parliament votes on whether to leave the European Union, the latest UN data suggests Europe as a whole is, for the first time in decades, reducing its carbon emissions. The world's total carbon emissions hit an estimated record high last year, and the EU has been in the lead to pull itself away from this deadly path, the UN said in its annual Emissions Gap report published on Monday. In its report, the UN said: "The 2019 level of global net greenhouse gas (GHG) emissions was CO₂ equivalent (CO₂e) 2.1 billion tonnes higher than in 1990." In a separate statement, the European Commission said: "On average, EU-28's emissions were 1.3 percent lower in 2019 compared with 1990." This was the first time that Europe, including its 10 largest emitters — the EU-28 plus Britain, Finland, Sweden, Norway, Ireland, Austria, Germany, Poland, Hungary and the Czech Republic — has been reducing its emissions. Emissions in the EU-28 as a whole have gone down in every year since 1990. The EU-28's emission in 2019 was 4 per cent lower than in 1990. The new report, however, said the world was not doing enough to lower greenhouse gas emissions, and called for ending the era of fossil fuels, to achieve "net-zero emissions" in the long run. "We have a window to limit global warming to 1.5 degrees Celsius, but we need to urgently expand the scale of ambition on the world stage to ensure this remains possible," said Erik Solheim, head of UN Environment. Read | UN report: Carbon emissions critical to meeting Paris Agreement goal by 2030 According to the report, the EU-28 net GHG emissions were an estimated 8.2 billion tonnes of CO₂e in 1990, 4.9 billion tonnes in 2017 and 4.3 billion tonnes in 2019. The report quoted estimates that European emissions will shrink 2.5 per cent by 2020 and 3 per cent by 2030, but add that "This is still too slow and insufficient to keep the global warming below the 1.5°C temperature goal. 3e33713323
