Benefits of AutoCAD AutoCAD has become a popular CAD program due to its ease of use and functionalities. AutoCAD is currently one of the most widely used CAD programs and is the standard in its field. Drawing Features in AutoCAD AutoCAD has built-in editing and drawing tools. These features include linear and radial (polyline) drafting and tools for vector editing and 2D/3D shape editing. You can even set up an entire drawing process and start creating new drawings. Linear (or One-Dimensional) drawing To create a linear drawing or to draw a polyline you can use the drawing tools on the left side of the main screen. The tool bar has a drawing or linetype tools such as Line, Spline, Area, Rectangle, Circle, Arc, Arc/Arc, Arc/Polygon, Polyline, Circle (Mnemonic for L), Arc/Line, Line, Spline, Polygon, Arc, Polyline, Area, Rectangle, Rectangle/Polyline, Gradient, Gradient/Polyline, Gradient/Rectangle. The basic tool bar also has a perspective tool, a plane tool, a levels tool, a linetype tool, a transform tool, a dimension tool, a wireframe tool, a shape tool, a drop tool, a lasso tool, and a multiple object selection tool. The drawing tools are organized into 6 groups: Line Tool: Draw a line Intersect: Draw a line perpendicular to the line you have drawn Duplicate: Draw a line of same length or same start point and same end point Select/Select as Polyline: Select lines and convert to polyline Find/Find as Polyline: Find similar shapes and convert to polyline Divide/Divide as Polyline: Divide line and convert to polyline Auto-complete: Fill polyline with line Define/Define as Polyline: Define polyline Envelope: Draw an envelope around polyline Horizontal and Vertical Tool: Draw horizontal or vertical lines Cross/Cross as Line: Draw a cross (horizontal or vertical line) Square: Draw a square Round: Draw a round Smooth: Draw a smooth curve Smooth/Smooth

Deep ventral (DVPB) and dorsal lateral geniculate nucleus (dLGN) neurons were studied in freely moving cats with histological and electrophysiological techniques. The effects of DVPB and dLGN lesions on thresholds for detecting and discriminating basic visual stimuli (plaids) and for detecting flicker were examined. dLGN lesions reduced the number of orientation-selective, "binocular" cells by approximately 40%. dLGN lesions also impaired discriminations based on differences in the 'length' of two gratings (plaid, spatial frequency discrimination), and on differences in their spatial phase (plaid, spatial phase discrimination).
