Sciences.[Role of anesthesia in the induction of coma]. The anesthetic technique used to sedate patients in clinical anaesthesia is almost always cardio-vascularly inactive (light sedation). It does not interfere with the induction of moderate or deep general anaesthesia. More often than not, this technique improves patient comfort when having advanced monitoring during these two types of anaesthesia. The induction of coma is however rarely a therapeutic intervention, and most often used after failure of the standard anaesthesia because of neurological problems. For the induction of coma in patients with neurological problem or brain injury, anaesthesia of an association of light sedation and inhalation anaesthetic agents are usually used. The anaesthetic technique used in that situation can also be associated with deep brain stimulation. The objective of this review is to elucidate the different types of anaesthetic technique used to induce coma and their associated practical features.Q: How to add child data to parent after rerendering Suppose we have: function f1() { var data = this.props.data.map(function(item) { return ; }); this.setState({ data: data }); } and function f2() { this.setState
