Monga Crack (LifeTime) Activation Code [Updated]

Monga is a SharePoint deleted files and sites recovery tool. It is a way to search and restore unwanted files and sites. Monga can retrieve your deleted files with their descriptions and all the content, like photos, word, excel, PowerPoint, and other documents, maps, videos, and images. It also can recover and restore unwanted sites, pages, and subfolders from Recycle Bin or other folders. Monga is compatible with sharepoint 2007 and sharepoint 2010 server versions. Most of the sharepoint sites are supported and it can retrieve everything from the all libraries, documents and folders. Monga has all basic components of a data recovery tool, like a file search/retrieval, a text search/retrieval, a text scanning, a text file recovery, a compression, and a email recovery. Monga

MongoDB REST API Online Backup is now available as a service that makes it easy to backup your MongoDB databases to Amazon S3. With this service, you only need to enable once, and the service will run at your cloud provider of choice in the background to back up your MongoDB databases without requiring any manual intervention by you or your cloud provider. REST API Online Backup can be accessed over a RESTful API or via the Node.js MongoDB API that you can also use to backup your databases. Here's a quick overview of how it works: 1) A REST API call to the MongoDB REST API automatically runs a daily backup of the database to a location on your cloud provider that you designate. 2) You can also backup MongoDB databases using the MongoDB Node.js API with our REST API adapter. The REST API call is an equivalent of the Node.js MongoDB API command `Object.create('database', 'collection')`. Why we decided to offer this service We started MongoHQ in 2012 because we loved MongoDB and the power that it brings to our customers and we are fundamentally different than other MongoDB companies. We don't want to sell MongoDB products, we want to bring great tools and services that are tightly integrated with MongoDB to our customers. We also value delivering great services that help make your MongoDB experience even easier and we believe we have a great product and service that meets all these requirements. We see MongoHQ as a critical component of this vision and we are excited about what we can offer our customers with this service. Restore MongoDB databases online from backup files In most cases, the backups can be restored via the REST API online backup. On an EC2 instance, just follow these steps to restore the backup. 1) Update the configuration file `/etc/mongodb.conf` to include your AWS access key and secret. 2) Delete the public/private key files stored under the EC2 key/certificate pair directory `/var/mongodb/ssl/` Enter the Public DNS endpoint of your mongo DB. Open the REST call in REST client. If you have backed up into another cloud like Azure, you have to contact support for the authentication of the backup file with the REST API backup. For example:
