If you want to watch a video on your desktop, use a full version of Windows Media Player or VLC, or FirePlayer. If you have trouble with the free version of Windows Media Player, you should pay money for a full version, and thus have all of the features. Additionally, in the Vista version, the way this app works is to show video items as icons. The only way to use your icons is to drag them from the main window to the desktop. For one thing, it is not fully functional, and you cannot use drag and drop to watch files. I wasted over a half hour trying to find out how to get the drag and drop to work. I was running an XP virtual machine, and I don't think that version of the app works either. Product Reviews This is a great tool.

Do you think there is anything wrong in my code? A: I think that the code that you wrote, to identify the situation in which the object exists and in which it is undefined, is correct. In the cases where XMLHttpRequest is undefined, it means that, in the current context, no object of this kind is present. Check the following two examples: In the Fiddle on codepen, the `xmlhrd.readyState` is "0" and the `xmlhrd.status` is "0". In the normal page (browser), the value of the
