It's a wild world out there. The rates of major natural disasters are very similar to the rate of global economic growth. If you're a top-dog business, why would you want to wait for things to get better before you make the moves? Better to do what you can to reduce the risks to your bottom line as things are. Although I'm not a big fan of the insurance industry, I've always had an admiration for the industry's ability to generate intelligent, well-crafted and researched arguments for why people should be compensated in the event of disasters. So I sat down in June last year and drew up the following list of the smartest company recommendations to help you make safer investments by protecting your business and your profit.

Q: Is it possible to get a torsional vibration (Bogie stability) from an AC motor? I have been trying to find an effect (not an application) that uses the idea of (relative) torque in a motor to be able to generate torsional vibration. The idea is simple, if you have a motor that has a higher peak torque than the motor winding resistance, the motor will tend to vibrate; this is basically the "Bogie stability" of AC motors and has been shown to exist in various traction motors (rear drive TDBs) I think that it would be useful to have a "zero torque startup" device based on this. I was thinking of maybe an AC motor with a wound magnetic rotor, with two possible configurations: A wound rotor with two magnetic poles at opposite positions. A wound rotor with only one magnetic pole at one position. I'm not quite sure if the second one is possible. Anyway, my question is, it is possible to have an AC motor go into torsional vibration for a very short time (tens of seconds), without the usual torque of the motor running? If yes, would this be, in any case, a motor designed for this application? A: As an answer to the question as written, the short answer is "no, you cannot make an AC motor do that." With the caveat that you can make it do almost anything, using just ordinary mains AC. Here are a couple of fun examples of non-random, but somewhat chaotic motion of a synchronous motor made with that approach: I won't bother to explain the effect, but basically it's just a synchronous motor doing what it's supposed to do, without the torque of the motor. (Although other types of motors would be more applicable. The turborotor is another example of this; I don't see how it's built into a load in the image, but you could adapt it to do something useful.) This invention relates to a technique for providing search results for a query from an information retrieval system. Information retrieval systems are designed to help users find relevant information in an information space. A user forms a search query representing the information that the user seeks. The information retrieval system attempts to identify and return relevant information resources, such as web pages, to the user. Relevant information is information that is highly related to the user's information needs
