* **Gimp:** Photoshop's graphical user interface is far more efficient in terms of the workflow that it provides to users; Gimp is a GUI (Graphical User Interface) editor for raster images. Although Photoshop may seem like the only photo editing program you'll ever need, if you're fed up with the interface, you can use Gimp to use Photoshop's features. It has most of the same tools as Photoshop but lacks the ease of Photoshop's workflow. * **Media Pro:** This program enables you to edit RAW images, apply special effects, and compress files for high-quality storage. Media Pro is created by Apple and can be downloaded for free from www.apple.com/macosx/photos/features/media-pro.html. ## Figure 6-4: The Browser tab of the Photoshop Elements toolbar contains a drop-down menu of the editing tools for the image.

Twin recombination in exon 3 of human and mouse HPRT genes. The existence of a splice variant of hypoxanthine-guanine phosphoribosyltransferase (HPRT) in mouse L cells that has a long 5' untranslated region and appears to be regulated independently of the de novo purine nucleotide synthesis was investigated. The existence of additional products of HPRT gene could be demonstrated in two types of human cells, by using a DNase I protection assay to study the polymorphism of the human HPRT gene. Eight and 19 single-strand protection sites were revealed in the exon 3 of the human and mouse genes, respectively. By using electrophoresis analysis of single-strand protected DNA fragments, we found that the human and mouse HPRT genes contain two identical twins, each composed of heteroduplex and homoduplex DNA segments with different polymorphic markers.

Getty Images The first-team offensive line depth chart has the words “present” and “absent” by two positions at the moment. It’s not actually a big problem, though. At least not for the Falcons, who apparently view what they’re doing with a group of out-of-work free agents this offseason as a great recruiting tool. “I know [the free-agent acquisitions] kind of help us add to our line — to the depth,” Falcons center Alex Mack said, via Vaughn McClure of ESPN.com. “To have guys that come in, whether from college or not, that we feel comfortable with — I don’t know that there’s anything better than that. You have confidence in them and you can kind of even watch them and just learn from them.” Mack also mentioned the team’s “age-related guys” who are on the other end of the spectrum. The line, which was already good before the offseason moves, is even stronger now. “They’re fighting it out,” Mack said of the younger linemen. “The group right now is definitely good, but you want to keep pushing. So for me, I’m just trying to compete, and I think we’re doing a good job of it.” The key words are “younger guys” and “pushing

Q: PHP Scripts not executing when called by cron I have a PHP file (index.php) that I am trying to run through cron. I am running the following command: `php /var/www/site/index.php` This works as intended, and the results are as expected. If I add any cron execution time to the file (`/var/www/site/index.php`), then the script fails with the following errors: `PHP: PHP Startup: Unable to load dynamic library '/usr/lib64/php/modules/php_mbstring.so' - /usr/lib64/php/modules/php_mbstring.so: cannot open shared object file: No such file or directory in Unknown on line 0` The results are exactly the same as executing the script directly with cron. I know that these errors can be caused by a corrupted PHP configuration file, but I don't think this is the issue. When I run the script by typing `php /var/www/site/index.php` it runs fine, so I know that it is working and can find the path to the PHP directory. A: I found a solution to this by checking my `php.ini` file, and then changing it to the following:

```
extension=${PATH_TOS_PHPDIR}/ext/mbstring.so
```

I then ran the cron job through `crontab` again. This time, there were no errors or problems with the script. My cronjob looks like this: `# www-data executes /var/www/site/index.php */5 * * * * www-data /var/www/site/index.php`
