The effect of IV injection of 50 micrograms of LTD4 was studied in the absence of endotoxin in normotensive rats (WKY) and in spontaneously hypertensive rats (SHR). Two series of experiments were carried out. In the first series LTD4 was injected in normal sodium diet containing 12.6 mmol NaCl/kg body weight, while in the second series of experiments, a high sodium diet (6 mmol NaCl/kg body weight) was used. In both groups, a hypotensive effect was induced by the injection of LTD4. In addition, sodium intake significantly influenced the hypotensive response to LTD4. These data indicate that some interaction between the mechanisms involved in the control of the hypotension of salt-induced and that induced by the peptide is involved.Q: How to transform foreign key of model to model in Django? I am implementing a mechanism where I have a view that renders some html template that will not have the same fields for each new item, so I need to create different fields for each item automatically. As you can see in the picture, the foreign keys are from a model, and I would like to move them to the "ordering" model that I'm already using, I have added all the models with the basic fields and fields required in the template. But how can I do this? I've been trying to get all the database data, but I can't do it since I need to know the primary keys, and I can't have foreign keys because I would need to use SET before each insert. To get the Ordering_Item table I would need to get the Ordering_Item_id to fill the field product_id field in the Ordering table. Thanks. A: You don't really need foreign keys, foreign keys are for an object of two tables. In your case, just add a method to your Ordering model, that takes a product and returns the Ordering_Item with the product_id you want. Then you can just pass it an object to the view and it will automatically have the right product_id 648931e174
