More particularly, the invention relates to a process for precipitating metal hydroxides using a salt solution which comprises ammonium hydroxide and an alkali metal salt. The invention further relates to a metal hydroxide produced by the process, and a process for producing fine particles from a powder. Metal hydroxides, particularly aluminum hydroxide, are used in many fields of application. For example, the metal hydroxide may be used to form a pigment to be used as a white pigment for plastic synthetic resin coating materials, painting materials, printing inks, paper coatings, cosmetics, and the like, and may be used in the fields of for example, industrial cleaning, the metal plating industry, and electronic industries such as cathodes in electrolytic reduction cells and cathodes in chloralkali electrolysis cells, as well as for use in the purification of waste water and river water. In many instances, metal hydroxides are produced by precipitating the metal hydroxide using a treating solution containing a salt solution. A process in which a salt solution containing an alkali metal hydroxide is used is known. When a metal salt containing an alkali metal is used, a metal hydroxide can be precipitated by adjusting the pH of the solution to a desired value. The precipitated metal hydroxide is then separated by various methods, such as separating the precipitated metal hydroxide from a reaction tank, filtering, centrifuging, and washing. The washed precipitated metal hydroxide may then be used as a pigment for, for example, plastic synthetic resin coating materials, paints, inks, cosmetics, paper coatings, and the like. U.S. Pat. No. 5,955,533 discloses a method for producing fine particles using a process in which a precipitated metal hydroxide is separated from a reaction tank. The '533 patent discloses a method for producing a fine particle powder using a procedure comprising separating the precipitated metal hydroxide from c6a93da74d
