The video on Midiworks and StyleMagic shows how to run software on MAC OS via virtual Parallels... I would be interested to know how it works with regular OSes. Is it some sort of virtualization software that automatically accesses data that is already on the virtual Mac? Are there any other benefits they provide? Thanks in advance, I've heard a lot of negative feedback from people who have used Virtual PC to work with programs and USB drivers that don't work in Parallels Desktop.
