Any keypad associated with the software is context sensitive, so you can have a programmable disc burning keyboard in the program, then use the track numbers that appear in your media. And Magix offers a couple of media-labeling modes. You can label clips with names, tags, and keywords, and when you use the search field, you can input text, such as title, description, or author. Drag a clip to a group, and the clip is inserted into the group in place of whichever clips already reside in the group. When you drag a clip out of a group, it leaves behind a placeholder group; you can also quickly eject a group by pressing the delete key. There are a few nagging glitches, however, such as some video clips that don't play, don't appear in the timeline, or become dead weight that takes up valuable space. There also seems to be a time in the past when the software could play some but not all of the clips I dragged from my library of video source files. As I mentioned earlier, I'm able to remove clips from the timeline, but I can't reorder them, move them to different tracks, or delete them. The storyboard view has a folder-like structure, but it doesn't seem to offer enough tabs to control it. It's not easy to organize your source files and keep track of what's what, and it seems that clips

are often not given enough space for titles, subtitles, and other movie information. The dialogue for a clip is not always positioned in a location where it can be seen. You can join or delete clips as a unit, though I found it easier to cut and paste clips to new tracks or delete groups, re-arrange clips in a group, or convert a group of clips to a single clip. You can also link tracks, and the linking uses the same methods that Apple offers for connecting apps. When you link a clip to a track, you can have the track display the linked clip at the beginning of the clip. This is a nice addition, especially if you want your editor to simply "see" the beginning of the clip when they enter the clip. The link feature also lets you design a timeline that clips have to fulfill in order to be included in the final movie. One of the advantages is that the program can re-export a finished project, editing and all, to DVD using a menu system that offers flexible and clear choices.
