**RevisionFX REFlex 5.2.8 Win X64**

---

revisionfx is a software rendering library for 3d applications. it is designed to have both 'fast' and 'real time' modes. in real time mode the gpu is used to perform all the rendering, and in fast mode the cpu performs the rendering, but can still support the gpu in real time. revisionfx is very fast, thanks to the use of off-the-shelf and free gpu drivers. other software rendering solutions can be twice as slow, and more expensive. revisionfx has a 30x speed increase over the last version of the plugin. note that the current version of revisionfx is a beta. it contains known bugs and may have unexpected results. if you are using an unsupported os, or a 3d application that is not supported, you may have unexpected results. you should expect some problems. revisionfx is designed to use the gpu of all platforms that it supports. it can use all available video memory, but the normal usage is that the gpu is mapped into all available video memory. if the gpu is not mapped into all available video memory, revisionfx may run slower. the windows version of revisionfx supports 3d acceleration on all newer cards, but it has been optimised for the opengl api, and therefore does not work on opengl versions earlier than opengl version 1.2. it may work on earlier versions, but this is not guaranteed. the revisionfx reflex 5.2.8 win x86

---

plugin is a software rendering solution for microsoft windows (win). it uses the opengl application programming interface (api) to perform all the rendering. this plugin does not include a gpu driver, and should be used with the revisionfx reflex installation. the revisionfx reflex plugin will not run on windows xp sp2.
