
FB Hacker V1.8 ##BEST##

most likely, the hacker will not have access to the login screen. the only way to learn the user's password is by guessing it. with a dictionary, the hacker can begin by guessing the most likely character for each of the characters in the password. the hacker can then try each password in the dictionary until one is accepted by the system. if the dictionary contains 10,000 characters and the hacker tries only 5,000 passwords, it takes only about 10 minutes to compute all of the fingerprints and guess the passwords. with salting, it takes many times longer. the hacker now has the username and password for the user. the hacker now needs to perform the next step in gaining unauthorized access to the system. if the account of the user is not blocked, the hacker can log in and proceed. if the account is blocked, the hacker will need to attempt to guess the user's password. if the hacker guesses correctly, the hacker will be able to gain unauthorized access to the system. if the password is weak, the hacker is able to use dictionary or brute force methods to guess the password. if the password is strong, the hacker will require something called a rainbow table, which stores all the possible combinations of characters for the password. this table allows the hacker to compute all of the fingerprints in the rainbow table in the time it takes to make one fingerprint with a dictionary. the hacker can then use the rainbow table to guess the password. once the hacker has a valid account, he can proceed to perform his ill will. if the system is running any type of server, the hacker can read the contents of the computer's hard drive. this can be done by reading the contents of the computer's system memory.
