the industrial uses of watermills in the islamic world date back to the 7th century, while horizontal-wheeled and vertical-wheeled water mills were both in widespread use since at least the 9th century, alongside the first windmills. a variety of industrial mills were active in the medieval islamic world, including fulling mills, gristmills, hullers, paper mills, sawmills, stamp mills, steel mills, sugar mills, and sugar mills, some of which were driven by watermills and others by early windmills. by the 11th century, every province throughout the islamic world had these industrial mills in operation, from al-andalus and north africa to the middle east and central asia. [157] these advances made it possible for many industrial operations that were previously driven by manual labour in ancient times to be driven by machinery instead in the islamic world. the transfer of these technologies to medieval europe later laid the foundations for the industrial revolution in 18th century europe. [158] muslim astronomers developed a number of astronomical instruments, including several variations of the astrolabe, originally invented by hipparchus in the 2nd century bce, but with considerable improvements made to the device in the muslim world. these instruments were used by muslims for a variety of purposes. in the 10th century, al-sufi first described over 1,000 different uses of an astrolabe, related to astronomy, astrology, horoscopes, navigation, surveying, timekeeping, qibla (direction to mecca), salah prayers, etc. [675] 5ec8ef588b
